

HEI receives follow-up order for biogas research project within the programme line “ENERGIE Systeme der Zukunft ~ energy systems of the future”

(12.10.2005) - The increased use of biogas can further enlarge the share of renewable energy sources in energy supply. In early 2005, HEI completed an extensive research project on the possibilities of biogas processing and feed-in into existing gas networks. The possibilities of the technology were rated positively.

The aim of the new research project is to enable a technology transfer to potential future plant operators and thereby initiate a large number of pilot plants for the feed-in of biogas into the natural gas network.

With its project suggestion regarding the feed-in of biogas into the gas network, HEI convinced an international board of judges within the programme line “energy systems of the future”. Upon the recommendation of the judges, the project is now funded by the Federal Ministry for Transport, Innovation and Technology.

The study “legal, economic and technical requirements for the feed-in of biogas into the Austrian gas network” can be ordered or downloaded on the website of the programme line “[Energy Systems of the Future](#)”.
